SUMMARY

Software engineering student focused on building practical systems that solve real problems. Built and shipped full-stack applications, AI agents, developer tools, and distributed systems using modern backend and cloud technologies. Constantly learning how things work and trying to understand the problem space — figuring out how to design better, more maintainable software systems. Enjoy building scalable products, exploring new technologies, and turning ideas into reliable software that improves workflows and the life of the people around me.

EDUCATION

FST Mohammadia

Ingénierie Logicielle et Intégration des Systèmes Informatiques (ILISI)

Mohammadia, Morocco

Sep 2024 — Present

WORK EXPERIENCE

Software Engineer Intern - Leyton CognitX

Jan 2025 — Jun 2025

Leyton CognitX

Mohammadia, Morocco

- Built a **real-time** financial market data processing system for Leyton CognitX, turning high-throughput event streams into searchable analytics and anomaly reports
- Designed a **distributed backend** with Kafka, FastAPI, Redis, Celery, and Elasticsearch to separate ingestion, processing, storage, and reporting into **independently scalable services**
- Improved **operational visibility** by implementing PDF, CSV, and JSON report generation with asynchronous email delivery for business-facing analysis workflows
- Containerized** the system with Docker and documented the architecture to make deployment, testing, and future handoff easier for the engineering team

PROJECTS

DoTunnel

npmjs.com/package/dotunnel

- Created a lightweight **HTTP tunnel proxy** to help developers expose local servers through **secure public URLs** without deployment friction
- Over **3.3k** downloads, used by developers to simplify local dev workflows and share work in progress.
- Provided a simple **CLI interface** for starting tunnels, logs, with custom subdomain and secure HTTPS connections

BrowserPilot

github.com/jounaidayoub/browserpilot

- Built a **browser AI agent** that helps users automate repetitive browsing tasks such tab-management, summarization, form filling, and data extraction
- Supports **local LLMs** so all processing can be done on the user machine without any data leaving their browser, ensuring **privacy and security**

Neurospark (Freelance)

neuro.jounaid.dev

- Shipped a full-stack cognitive games platform for a team that needed an app to present at education centers during a **national competition**
- Features multiple game variants with **progressive difficulty** and **haptic vibration cues** that adapt to each child's cognitive exercises designed for children with **learning difficulties** to build skills at their own pace
- Set up a **serverless backend** on Cloudflare Workers with Hono + D1, frontend in React/TypeScript with Tailwind , parent/child profiles, Google OAuth, admin panel, bilingual onboarding, and **mobile-first** design

SKILLS

- Backend & Distributed Systems: Hono , FastAPI, Kafka, Redis, Celery, Elasticsearch, REST APIs, asynchronous processing, event-driven architecture
- AI & Developer Tools: LLMs , AI sdk , RAG, browser automation, agentic workflows, CLI/TUI tooling
- Cloud & DevOps: Docker, Cloudflare Developer Platform, Linux, Git, GitHub Actions, CI/CD pipelines, deployment automation
- Languages & Frameworks: TypeScript, Python, C/C++, SQL, React, Angular, Nest.js
